TITLE: Automated diagnosis of printer systems using
Bayesian networks

----- KWIC -----

Detailed Description Text - DETX (178):

FIGS. 10A through 10E graphically illustrates a series of arc-reversals reversing the direction from question to causes. An arc-reversal is an operation that reverses an arc in a Bayesian network from A to B while adding the parents of A to B, and vice-versa. See Shachter, R. D., Evaluating Influence Diagrams. Operations Research 34 (6), 871-882 (1986).
